EOS [EOS] Rating

EOS

The most powerful infrastructure for decentralized applications

Description

EOS, by block.one, is a platform similar to Ethereum in that it enables the development of dApps and smart contracts, with a focus on speed, scalability and user experience. Beyond that, it is a complete operating system for decentralized applications that services things like user authentication, storage, and hosting.

The idea is that they have taken the best aspects of other platforms and brought them together into an easy to use and highly scalable alternative. One of their principal claims early on was that they'd fix Ethereum's scaling problems by offering an

alternative network that would eliminate transaction fees and process millions of transactions per second. Dan Larimer leads the Block.one team, noted for his participation in the successful blockchain projects Bitshares and Steemit

EOS began its ICO in the middle of 2017 and ran for an entire year. The project ended up raising about USD 4B during the ICO even though the project was largely conceptual at the time. Because there was no EOS blockchain, a stopgap measure was introduced to allow the issue of EOS tokens. Ethereum ERC-20 tokens were released with the expectation that they could be later exchanged for native EOS tokens. In addition to the ICO, they have also attracted funding from high profile investors such as Peter Thiel and Bitmain.

The EOS investor and development community is global, passionate and very lively. Github activity is one of the highest amongst its peers.

Hype and Reach

EOS has a superb reach, along with a great social following. The project has substantial hype, with a lot of buzz on social media around the coin.

Community Trust/Red Flags

The community trust score concerning this project is relatively poor, suggesting that there might be ongoing legal cases, general community misfeelings, suspect whitepaper deliverables, or lack of development.

Transparency

EOS looks to be quite transparent in regard to its commercial operations, with a privacy policy, legal disclaimer and some contact information available to view on its website.

Backing

The project has the support of one or more VC companies, other institutions or notable backers. Projects which are backed are often considered low risk.

Product Completion

The completion score for this project is relatively good, implying that a testnet or MVP has been launched.

Conclusion

Taking all metrics into consideration, this project has a relatively good final score, but there could be some fundamental risks involved with investing in this project. Projects with scores in this range often have varied scores in different areas, and these should be assessed independently.

Any potential investors are advised to read the **EOS** whitepaper, which is available to view [here](#).
