

# TRON

## Project Name

TRON Coindaily Rating: **BB-**

## Key Words

DPOS, EOS, Justin Sun

## Project Overview

TRON is a public blockchain using DPOS, it offers scalable and high-throughput support for DAPPs.

## Project benefits.

- 1) TRON is hot at home and abroad, and many top exchanges have listed TRX.

## Concerns

- 1) TRON is very similar to EOS, it can be regarded as the younger brother of EOS.
- 2) The market for public blockchains is extremely competitive, and EOS is the most powerful competitor.

## Team

Justin Sun, Funder of TRON, who is very good at public relations and marketing, specializes in promotion and community operations. It can be said that the operation team relies on him alone.

The technical team has rich experience in web development, but lacks experience in blockchain.

## Conclusion.

TRON has made a log of modifications to its positioning and implementation path from the crowdsale to the development stage. Now, it has clearly defined itself as a public blockchain based on DPOS after bypassing some difficulties and eliminating some functions, the development difficulty is much lower than the description in white paper. The mainnet has been launched on May 31, 2018, however, whether the TPS can be increased to tens of thousands and how to build the follow-up ecosystem remains to be seen.

**Comprehensive rating: BB-**
